

### AD3030 – Eastern part of Yarmouk basin

Well AD3030 “UM ESRAB OBSERVATION 1” is a monitoring well near a pumping center where the groundwater levels are declining about -2 m/yr. With only a few measurements, Clark (2002) estimated that the water level in well AD3030 was declining less than -1 m/yr during 1998-2001, but this was based on only a few measurements, and probably based on nearby monitoring well trends. The B2/A7 aquifer is present to a depth of 285 m at this location, but the well is only 209 m deep. This monitoring well is projected to be dry within a year or two.
